How to Use Your Owner Reporting Dashboard

SKU PAM-001 · OWNER REPORTING DASHBOARD

What this workbook does

Per-owner monthly P&L for property managers and co-hosts running 5+ properties owned by other people. Aggregates revenue per owner across properties, breaks out expenses per owner, applies the commission split, and outputs a print-ready monthly statement that the owner actually opens and reads.

For multi-owner property managers (or co-hosts running properties for absent owners), this is the report that retains owner trust month after month.

First-time setup (30 min)

1. Open tab **Owner Roster** — every owner with their properties, ownership %, contact info, distribution preference (ACH / check / Venmo).
2. Tab **Property Roster** — every property under management, owning entity, commission split (typical: 15-25% of gross), expense pass-through rules.
3. Tab **Settings** — month-end close date, statement send date.

Every month

1. Update the Revenue Log (or import from Airbnb / Vrbo / direct).
2. Update the Expense Log (with property + owner tags).
3. Open the **Per-Owner P&L tab** — auto-aggregates by owner.
4. Print or PDF each owner's statement. Send.

What's on the owner statement

- Per-property revenue (gross + net after channel fees)
- Per-property expenses (cleaning, supplies, maintenance, etc.)
- Property NOI
- Your management commission (commission % × gross OR % × NOI per agreement)
- Owner distribution amount
- YTD summary

Year-end

The Year-End Summary per owner outputs:

- Annual gross revenue
- Annual expenses by category
- Annual NOI
- Total commission paid to PM
- Owner's share (1099-equivalent for the owner's tax filing)

The owner hands this to their CPA. Saves the owner from begging you for line-item detail in March.

Questions?

hello@thestrledger.com — real humans, fast replies.

Pair with: PAM-002 Cleaner CRM + Payroll (the operational side of multi-property management), PAM-003 Commission Split Calculator (if you have variable splits across owners), TAX-013 Depreciation Tracker (owner-side basis tracking).

How to Use Your Multi-Property Master P&L

SKU TAX-011 · MULTI-PROPERTY MASTER P&L

What this workbook does

The portfolio-level P&L for hosts running 3+ STR properties, possibly across multiple LLCs. Per-property revenue and expense logging, asset-by-asset depreciation register, LLC consolidation, and Schedule E roll-up that hands your CPA a clean year-end with property-by-property breakdown.

This is the upgrade path from TAX-002 (single-property). When you're past one rental, the math gets non-linear: shared expenses (CPA fees, software subscriptions, vehicle costs) need allocation across properties, separate LLCs need separate K-1 records, and depreciation runs across 30+ assets at multiple recovery periods.

First-time setup (30 min — yes, really)

1. Open tab **Settings** — set the active tax year, configure the LLC list (single-member LLCs, multi-member LLCs, or sole-prop direct).
2. Tab **Property Roster** — add each property: name, address, owning entity, purchase date, purchase price, land value, in-service date, days rented YTD, personal-use days.
3. Tab **Revenue Log** — paste bookings from Airbnb / VRBO / direct. Filter column tags each booking to its property.
4. Tab **Expense Log** — every property-specific expense gets logged with property tag. Shared expenses (CPA fees, vehicle, software) go on the **Shared Expense Allocator** tab.
5. Tab **Asset Register** — every depreciable asset across the portfolio. Property tag + MACRS class + in-service date + cost basis + §179 / bonus elections.

The shared-expense allocation logic

Many expenses don't cleanly belong to one property: your CPA fee, your vehicle, your software subscriptions (PriceLabs, Hostfully, AirDNA). The workbook allocates these across properties using one of three methods (configurable per category):

- **By revenue share** — most defensible for variable expenses (software fees that scale with usage)
- **By property count** — simple, defensible for flat-fee services (CPA prep)
- **By usage tracking** — for vehicle (mileage per property), home office (hours per property)

The LLC consolidation logic

If you run multiple LLCs:

- Each LLC's revenue + expenses + assets stay on that LLC's lane
- The Schedule E Roll-up tab outputs a Schedule E per LLC (each becomes a column on Form 1040 Schedule E)
- A Multi-LLC Summary tab consolidates for your overall picture

At year-end

1. Confirm every property's 2026 row on the Property Roster has correct values (especially personal-use days — drives Pub 527 14-day test).
2. Confirm the Asset Register is current — any new assets, dispositions, or §179 elections from the year.
3. Open Schedule E Roll-up — print the per-LLC summary tabs.
4. Hand the file (or printed roll-ups) to your CPA. Three properties' worth of cleanup just turned into a 30-minute review.

hello@thestrledger.com — real humans, fast replies.

How to Use Your RevPAR Dashboard

SKU FIN-001 · REVPAR · ADR · OCCUPANCY DASHBOARD

What this workbook does

Computes the three numbers your portfolio actually runs on: **RevPAR** (revenue per available night), **ADR** (average daily rate), and **occupancy**. Across every property, every month, with portfolio rollup. Plus quarter-over-quarter momentum and a comp-vs-self check.

Gross revenue lies. RevPAR doesn't. A property that grossed $42K with 70% occupancy at $164 ADR is on a different trajectory than one that grossed $48K with 50% occupancy at $263. The first is winning per available night. The second is leaving money on the table.

First-time setup (10 min)

1. Open tab **Property Roster** — add each property: name, beds, baths, market, opening date, available nights per month (typically 28-31, less if you take owner stays).
2. Tab **Booking Log** — paste your booking export from Airbnb / VRBO / direct. The workbook accepts: check-in date, check-out date, gross revenue, channel, property.
3. Tab **Settings** — set the comp benchmarks for your market (AirDNA market RevPAR / ADR / occupancy). The workbook color-codes you against benchmark.

Every month

1. Update the Booking Log with the prior month's bookings.
2. The Monthly Dashboard auto-updates: per-property RevPAR / ADR / Occupancy + portfolio average.
3. Open the Momentum tab — quarter-over-quarter delta per metric, per property.
4. Read the verdict column: WINNING (above market on RevPAR), MIXED (above on ADR but below on occupancy, or vice versa), LOSING (below on both).

Reading the outputs

- **RevPAR:** revenue ÷ available nights. The single most important STR metric.
- **ADR:** revenue ÷ booked nights. Your pricing power.
- **Occupancy:** booked nights ÷ available nights. Your demand capture.
- **RevPAR = ADR × Occupancy.** If RevPAR is down, only one of those two moved. The dashboard tells you which.

Common patterns

- **High ADR, low occupancy** → priced too high for current demand. Loosen min-stay or drop ADR by 8-12% to capture more nights.
- **High occupancy, low ADR** → underpriced. Raise base rate by 5-10%, run for two weeks, see if occupancy holds.
- **Both flat YoY but market RevPAR is up** → your listing is losing search rank. Run the SEO Audit (MKT-001) to fix.
- **Both up YoY but market RevPAR is flat** → you're winning. Document what you changed; replicate across portfolio.

Quarterly review

The Quarterly Review tab summarizes each property: best quarter, worst quarter, biggest delta, and a recommendation column. Use this for portfolio-level decisions: which property gets the next renovation budget, which one needs a price reset, which one is ready to sell.

Questions?

hello@thestrledger.com — real humans, fast replies.

Upgrade path: Pair with the Dynamic Pricing Calculator (REV-002) to act on the recommendations, the Competitor Rate Tracker (REV-003) for comp-set monitoring, and the Multi-Property Master P&L (TAX-011) for the financial side.

How to Use Your Damage Claim + AirCover Log

SKU OPS-002 · DAMAGE CLAIM + AIRCOVER LOG

What this workbook does

Logs every damage incident with photo evidence, claim status, and recovery dollars. Tracks both Airbnb AirCover claims and supplemental commercial-policy claims side-by-side. Outputs a claim-ready packet your AirCover specialist (or insurance adjuster) can review without a follow-up email.

Most hosts file AirCover claims badly — incomplete photo evidence, no pre-stay/post-stay comparison, no itemized cost estimate. Recovery rates suffer. This workbook turns claim filing from a 2-hour reactive scramble into a 15-minute structured process.

First-time setup (10 min)

1. Open tab **Property Roster** — list every property with insurance policy details (AirCover by default, supplemental policy if any, deductible, agent contact).
2. Tab **Photo Storage** — set the cloud-photo-storage convention (typically Google Drive folder per property + per stay).

Every incident

1. Open tab **Incident Log**. Add a row: date discovered, property, guest reservation #, brief description.
2. Take photos: damage close-ups, wider context, any related items (e.g., broken door + the lamp it knocked over). Paste cloud links into the Photos column.
3. Reference the pre-stay condition: ideally you have walkthrough photos at every check-in. Log the difference.
4. Itemize replacement / repair costs. Get one quote (or one Amazon/Home Depot link with current price) per item.

Filing the claim

Open tab **Claim Packet** — this is the printable summary. Includes:

- Reservation # + dates + guest details
- Pre-stay vs post-stay photo comparison
- Itemized damage list with replacement costs

- Total claim amount
- Supporting documentation links

Submit through Airbnb Resolution Center for AirCover OR upload to your supplemental insurer's portal. Mark claim status: Filed / Approved / Partial / Denied.

Quarterly review

Open the Recovery Rate dashboard. Total $ recovered ÷ total $ claimed. Healthy rate: 60-80%. Below 40% means your evidence/documentation is weak; the workbook's checklists fix this.

Questions?

hello@thestrledger.com — real humans, fast replies.

Pair with: OPS-001 Cleaner Turnover Checklist (catches damage at the source — between guests), OPS-008 Insurance Policy Tracker (your annual policy renewal calendar).

How to Use Your License / Permit / STR-Reg Tracker

SKU OPS-003 · LICENSE / PERMIT / STR-REG TRACKER

What this workbook does

Tracks every STR license, business license, sales tax permit, fire/safety inspection, and lottery/renewal date per property. Shows a countdown to the next deadline so you never lose your listing because a permit lapsed.

For multi-jurisdiction hosts (properties across several cities, counties, or states), this becomes essential — most STR-bans are enforced via permit-expiration audits. A $2,500 permit you forgot to renew can take your $48,000/yr listing offline.

First-time setup (15 min)

1. Open tab **Property Roster** — list every property with its full permit register: STR license, business license, sales/lodging tax registration, fire inspection certificate, occupancy permit, HOA approval (if applicable), any state-level lottery (e.g., Joshua Tree CA, Sedona AZ).
2. Tab **Permit Detail** — for each permit: issuing authority, license number, issue date, expiration date, renewal lead time, renewal cost, supporting document link.
3. Tab **Settings** — set your warning thresholds (e.g., 60 days before expiry → yellow flag; 30 days → red flag).

Every month

1. Open the Calendar tab. Yellow flags = renew this month. Red flags = renew this week.
2. Renew. Update issue + expiration dates. Document link.
3. The Penalty Reference tab shows what happens if you miss a deadline by jurisdiction (typically: fines $250-$5,000 + listing suspension until cured).

When acquiring a new property

1. Add it to the Roster on closing day.
2. Within 30 days, fill in the full permit register. Don't wait — most jurisdictions have 14-30 day registration windows after closing.
3. Set calendar alerts on your phone for the first three renewals (the workbook is the master record; phone alerts are the redundancy).

Multi-jurisdiction operators

If you're across 3+ jurisdictions, sort the Calendar tab by month to see the rolling year of renewals at a glance. Single-property hosts can ignore this view.

Questions?

hello@thestrledger.com — real humans, fast replies.

Pair with: LGL-001 STR License Renewal Calendar (the calendar-only view of the same data), LGL-002 TOT Filing Calendar (sales/lodging tax filing dates — different cadence, often monthly/quarterly), TAX-002 Single-Property P&L (tax registration fees deduct on Line 17).

How to Use Your Listing SEO Audit

SKU MKT-001 · LISTING SEO AUDIT

What this workbook does

Scores your Airbnb / VRBO listing against 25 ranking criteria — title, photos, description, amenities, response time, reviews, calendar hygiene, pricing rules, instant-book settings, host signals. Each criterion is pass/fail with a fix-instruction. Output: a prioritized fix list ranked by impact.

Search rank is the single biggest lever for an STR listing that exists but isn't booking. Most "low occupancy" problems are actually "low search-rank" problems. This workbook is the audit you run before you change anything else.

First-time setup (10 min)

1. Open tab **Listing Snapshot** — paste your Airbnb / VRBO listing URL, current title, current top photo, last 30-day occupancy, average response time.
2. Tab **Audit Checklist** — walk the 25 criteria one by one. For each, mark Pass / Fail and add a one-line note.
3. Tab **Re-audit Tracker** — log today's date as "Audit 1." Future re-audits add Audit 2, Audit 3 columns to track improvement.

The 25 criteria — what they cover

- **Title (3 criteria):** keyword density, length, character utilization
- **Photos (5):** hero photo composition, total photo count, caption coverage, exterior + amenity coverage, photo recency
- **Description (3):** opening hook, amenity bullet density, length
- **Amenities (3):** filtered-amenity coverage, premium-amenity claims, accuracy
- **Pricing rules (3):** min-stay strategy, weekend pricing, gap-night pricing
- **Calendar hygiene (3):** availability runway, recently-blocked dates, instant-book setting
- **Host signals (3):** response time, response rate, review count + score
- **Search rank levers (2):** booking velocity, last-30-day occupancy

Reading the outputs

- **Audit Score:** total Pass count out of 25. Healthy listings score 20+. Below 15 indicates a listing that's effectively invisible.
- **Fix List:** every Fail row sorted by impact. Top 5 should fix in week 1; remainder over weeks 2-4.

- **Estimated Rank Lift:** workbook's estimate of search-rank improvement per fix. Use this to prioritize.

The work flow

1. Audit. Mark every Pass / Fail honestly.
2. Pick the top 3 highest-impact fixes from the Fix List. Implement this week.
3. Wait 14 days for Airbnb's search-rank algorithm to re-evaluate.
4. Re-audit. Compare scores. Track which fixes moved which metrics.
5. Repeat.

Common patterns

- **Title fail + photo fail = no bookings.** Fix these first; everything else is downstream.
- **High audit score but low occupancy** → not a search-rank problem. Run the Cleaning Fee Optimizer (REV-001) and Dynamic Pricing Calculator (REV-002).
- **Audit score improves but occupancy doesn't** → you're in a market that's softening. Check FIN-001 RevPAR Dashboard against your comp set.

Questions?

hello@thestrledger.com — real humans, fast replies.

Upgrade path: The Full version on thestrledger.com expands to 40 criteria + a sourced Methodology tab + Top-5 Comp Compare. The Marketing Bundle pairs it with the Review Response Tracker (MKT-002) and Referral / Repeat-Guest CRM (MKT-003).

How to Use Your Cleaning Fee Optimizer

SKU REV-001 · CLEANING FEE OPTIMIZER

What this workbook does

Compares three cleaning-fee strategies side-by-side:

1. **Charge separately** — list the cleaning fee as a line item ($85, $120, etc.)
2. **Bundle into nightly rate** — fold the cleaning cost into the per-night price, advertise "no cleaning fee"
3. **Hybrid** — partial fee + partial bundle, a balance

For each strategy, it computes booking conversion (lower with high cleaning fees), search-rank impact, average daily revenue, and annualized $ delta. Output: a recommendation specific to your average length of stay and market.

This is the most-debated line item on Airbnb. The answer depends on your average LOS — short stays favor bundling, long stays favor separate. The workbook does the math.

First-time setup (5 min)

1. Open tab **Inputs** — your cleaning cost per turn, current cleaning fee charged to guests, current ADR, your average length of stay (LOS).
2. The workbook auto-computes the three scenarios.

Reading the outputs

- **Strategy A (Separate):** highest dollar transparency, lowest booking conversion. Best for properties where most stays are 5+ nights.
- **Strategy B (Bundled):** highest booking conversion, lower per-booking revenue. Best for properties where most stays are 2-3 nights.
- **Strategy C (Hybrid):** balanced. Cleaner economics for properties with mixed LOS distribution.
- **Recommendation cell:** which strategy nets the highest annualized revenue at YOUR LOS distribution.

The math behind it

A $120 cleaning fee on a 2-night stay adds 60% to the total guest price. On a 7-night stay, it adds 17%. Airbnb's search ranking factors total guest price; high cleaning fees tank ranking on short-stay properties specifically.

The optimizer's recommendation accounts for this: if your average LOS is <3 nights, bundling typically wins by $1,500-$4,500/year per property. If your average LOS is >5 nights, separate fees typically win by $800-$2,000/year because the per-stay cleaning cost is amortized across more nights.

When to re-run

- After any pricing change (PriceLabs adjustment, base-rate move)
- When your LOS distribution shifts (e.g., new min-stay rule)
- Quarterly, even if nothing changed — Airbnb's search algorithm shifts, and the optimal strategy can drift

Questions?

hello@thestrledger.com — real humans, fast replies.

Upgrade path: The Full version on thestrledger.com adds LOS sensitivity analysis (short/mid/long-stay cohorts) and Airbnb search-rank impact estimation. The Revenue Bundle pairs it with the Dynamic Pricing Calculator (REV-002) and Min-Night Stay Optimizer (REV-004).
